

STATISTICAL BRIEF #61

December 2004

National Health Care Expenses in the U.S. Community Population, 2002

David Kashihara and Kelly Carper

Introduction

This Statistical Brief presents estimates on the health care expenses in the U.S. civilian noninstitutionalized (community) population in calendar year 2002. The national estimates are derived from the Household Component of the Medical Expenditure Panel Survey (MEPS-HC), which provides annual national estimates of health care use and expenditures. Health care expenses, as reported in this brief, represent payments to hospitals, physicians, and other health care providers for services reported by respondents in the MEPS-HC. These expenses are defined as direct payments by individuals, private insurance, Medicare, Medicaid, and other payment sources. All differences between estimates discussed in the text are statistically significant at the 0.05 level.

Findings

In 2002, the U.S. community population had total expenses of \$810.7 billion, consisting of payments for hospital inpatient and outpatient care; emergency room services; office-based medical provider services; dental services; home health care; prescription medicines; and other medical services and equipment (figure 1). Among the 85.2 percent of the population with an expense, the median and mean expenses were \$960 and \$3,302, respectively. A small proportion of the 14.8 percent of the population who did not have health care expenses during 2002 received health services for which no direct payments were made.

Hospital inpatient expenses for both facility and separately billed physician services accounted for 31.6 percent of the total expenses of the community population, while another 22.2 percent of the total was for office-based medical provider services (figure 2). Total emergency room expenses were 3.4 percent of total expenses (\$27.9 billion; data not shown), which is relatively small compared to other ambulatory medical care expenses (\$78.9 billion for hospital outpatient services and \$180.0 billion for office-based medical provider services; data not shown).

Prescription medicine expenses accounted for 18.6 percent of spending on health care, and the mean expense for these

Highlights

- Health care expenses among the community population were \$810.7 billion in 2002, with slightly less than a third (31.6 percent) of the expenses related to hospital inpatient services.
- Overall, the mean and median expenses of persons with any expenses in 2002 (85.2 percent of the community population) were \$3,302 and \$960, respectively.
- Prescription medicine expenses accounted for 18.6 percent of community population spending on health care, and the mean expense for these medicines among those with expenses was \$812.
- Total emergency room expenses were \$27.9 billion (3.4 percent of total expenses). This was relatively small compared to other ambulatory medical care expenses (\$78.9 billion for hospital outpatient services and \$180.0 billion for office-based medical provider services).
- Private medical insurance—the largest third party payer—covered 39.7 percent of total payments. Medicare and Medicaid—the primary public programs—combined paid 32.8 percent of the total.
- Uninsured people under age 65 with health care expenses had relatively lower mean expenditures (\$1,491), while those age 65 and older on Medicare and other public insurance had relatively higher expenditures (\$10,222).

medicines was \$812 (figure 3). The mean expense among those with expenses ranged from a high of \$11,855 for hospital inpatient services to a low of \$338 for other medical equipment and services, but the proportion of people with expenses varied widely (ranging from 2.1 percent to 72.2 percent) by type of service (figure 4).

Health care expenses are paid by individuals and third party payers, such as private insurance and public programs. In 2002, private insurance covered 39.7 percent of the total expenses; individuals and family members paid out of pocket 19.1 percent; and Medicare and Medicaid combined paid 32.8 percent (figure 5).

As shown in figure 6, health care expenses were not uniformly distributed across the community population. Uninsured people under age 65 with expenses were characterized by relatively lower expenditures; those with expenses had a mean expense of \$1,491. In comparison, persons age 65 and older on Medicare and other public insurance were characterized by relatively higher expenditures; those with expenses had a mean expense of \$10,222.

Data Source

The estimates in this Statistical Brief are based upon data from the MEPS 2002 Full-Year Consolidated Data File: HC-070.

Definitions

Expenditures

Expenditures included the total payments from all sources to hospitals, physicians, other health care providers (including dental care), and pharmacies for services reported by respondents in the MEPS-HC. Sources included direct payments from individuals, private insurance, Medicare, Medicaid, and miscellaneous other sources. Expenditures for hospital-based services include those for both facility and separately billed physician services.

Uninsured

People who did not have insurance coverage at any time during the survey year were classified as uninsured for the full year. People who were covered only by noncomprehensive State-specific programs (e.g., Maryland Kidney Disease Program) or private single service plans (e.g., coverage for dental or vision care only, coverage for accidents or specific diseases) were considered to be uninsured.

Public only coverage

People were considered to have public only health insurance coverage if they were not covered by private insurance, and they were covered by Medicare, Medicaid, TRICARE, or other public hospital and physician coverage.

Private coverage

Private health insurance coverage was defined as non-public insurance that provided coverage for hospital and physician care (including Medigap coverage).

About MEPS-HC

MEPS-HC is a nationally representative longitudinal survey that collects detailed information on health care utilization and expenditures, health insurance, and health status, as well as a wide variety of social, demographic, and economic characteristics for the civilian noninstitutionalized population. It is cosponsored by the Agency for Healthcare Research and Quality and the National Center for Health Statistics.

For more information about MEPS, call the MEPS information coordinator at AHRQ (301-427-1406) or visit the MEPS Web site at <http://www.meps.ahrq.gov/>.
